

Zzzillow – *Take your dreams to the next level*

Week 1

The group decided to create a website that presents the idea of Lucid dreaming. Zzzillow is a device that allows people to have lucid and vivid dreams. There are already devices out there that does something similar. However, these devices apparently needs the dreamer to “wear” something on their head while sleeping. And that is why we came up with the idea of having a *pillow* do the job.

Our group consists of 5 students, making the job easier and faster. We split up into three teams. One team would code the HTML, the other CSS and the last team would write the content. On the same day, we also learned to use GitHub. This proved to be very useful and made our progress easier. We also created a Facebook group chat to communicate with each other.

During the first week, we were able to complete the website along with the content. The website was very simple and explained the idea in a very detailed way.

Week 2

On the second week, we received feedback from the TA. Fortunately, our website was so cool that it even amazed the TA. We were told to redesign the website by making it a bit more flashy.

We decided to change the font and create some space between the texts. We tried to add some images, but it just wouldn't blend in properly with the amazing background. This is also the week where this documentation you're reading right now, was written.
